

ABSTRACT OF THE DISCLOSURE

The specification discloses a web AV recording device and the corresponding method. The device includes connectors, a transceiver, a storage device, and a processor. The connectors connect to external web devices. The transceiver connects to the connectors
5 for transceiving AV signals. The storage device stores a comparison table, which records the correspondence between web device address and web addresses. The processor connects to the transceiver and the storage device. After the processor receives the AV signals transmitted from the transceiver, the AV signals are processed according to their internal and external signal forms. Therefore, the invention can process its internal and
10 external AV signals and transmit AV signals between two web devices.
